A Study of the Ability of Young Children to Control Breathing Oct 19 2021

Photosynthesis, Respiration, and Climate Change Jul 16 2021 Changes in atmospheric carbon dioxide concentrations and global climate conditions have altered photosynthesis and plant respiration across both geologic and contemporary time scales. Understanding climate change effects on plant carbon dynamics is critical for predicting plant responses to future growing conditions. Furthermore, demand for biofuel, fibre and food production is rapidly increasing with the ever-expanding global human population, and our ability to meet these demands is exacerbated by climate change. This volume integrates physiological, ecological, and evolutionary perspectives on photosynthesis and respiration responses to climate change. We explore this topic in the context of modeling plant responses to climate, including physiological mechanisms that constrain carbon assimilation and the potential for plants to acclimate to rising carbon dioxide concentration, warming temperatures and drought. Additional chapters contrast climate change responses in natural and agricultural ecosystems, where differences in climate sensitivity between different photosynthetic pathways can influence community and ecosystem processes. Evolutionary studies over past and current time scales provide further insight into evolutionary changes in photosynthetic traits, the emergence of novel plant strategies, and the potential for rapid evolutionary responses to future climate conditions. Finally, we discuss novel approaches to engineering photosynthesis and photorespiration to improve plant productivity for the future. The overall goals for this volume are to highlight recent advances in photosynthesis and respiration research, and to identify key challenges to understanding and scaling plant physiological responses to climate change. The integrated perspectives and broad scope of research make this volume an excellent resource for both students and researchers in many areas of plant science, including plant physiology, ecology, evolution, climate change, and biotechnology. For this volume, 37 experts contributed chapters that span modeling, empirical, and applied research on photosynthesis and respiration responses to climate change. Authors represent the following seven countries: Australia (6); Canada (9), England (5), Germany (2), Spain (3), and the United States (12).

[Pathophysiology of Respiration](#) Sep 25 2019 This book presents a range of research and clinical contributions, including observational studies, practical treatment examples, diagnostic test assessment, biomarkers, and systematic reviews. The objective is to seek to explain the processes or mechanisms whereby abnormal or undesired conditions develop and progress. The attention is given to disturbed carbohydrate metabolism in perpetuation of respiratory ailments or raising therapeutic problems. The psychosocial context of chronic respiratory conditions is tackled as well. Oxidative stress is conducive to both physical and cognitive aging, which raises the specter of using its biochemical markers in future antiaging therapeutic strategies. Critical information provided in the contributions will allow readers to make informed judgments. The book will hopefully serve to create awareness and apprehension about the developments in the field of pneumology and related areas of medical research.

The Life of Breath in Literature, Culture and Medicine Aug 17 2021 This open access book studies breath and breathing in literature and culture and provides crucial insights into the history of medicine, health and the emotions, the foundations of beliefs concerning body, spirit and world, the connections between breath and creativity and the phenomenology of breath and breathlessness. Contributions span the classical, medieval, early modern, Romantic, Victorian, modern and contemporary periods, drawing on medical writings, philosophy, theology and the visual arts as well as on literary, historical and cultural studies. The collection illustrates the complex significance and symbolic power of breath and breathlessness across time: breath is written deeply into ideas of nature, spirituality, emotion, creativity and being, and is inextricable from notions of consciousness, spirit, inspiration, voice, feeling, freedom and movement. The volume also demonstrates the long-standing connections between breath and place, politics and aesthetics, illuminating both contrasts and continuities.

Respiration and metabolism of embryonic vertebrates Feb 29 2020 The papers in this volume were presented at an international symposium, held in South Australia on September 8-10, 1983. The purpose of the meeting was to present the comparative physiology of gas exchange, water balance and energetics of developing vertebrate embryos. contributions were invited from leading research workers in an attempt to represent the forefront of investigation of all vertebrate classes and to promote a broadly comparative approach to the study of embryonic physiology. These proceedings therefore reflect the current level of research activity focus ing on each group of vertebrates. While considerable expansion and specializa tion has occurred in the area of avian embryos over the last decade, work on reptilian embryos is less developed and that on fish and amphibians is still in its infancy. Although a great deal is known about respiration and metabolism in embryos of placental mammals, the physiology associated with the curious mode of development of monotreme and marsupial embryos has not been examined until recently. In this symposium, the well-studied vertebrate classes are repre sented primarily by specific research papers that document original work. These are balanced by more extensive reviews of the lesser known classes.
