

covers the following topics linear and nonlinear structural analysis
amplitude curves massachusetts institute of technology Jul 31 2020 web choose the tabular definition method default to define the amplitude curve as a table of values at convenient points on the time scale abaqus interpolates linearly between these values as needed by default in abaqus standard if the time derivatives of the function must be computed some smoothing is applied at the time points where the time
crushable foam plasticity models massachusetts institute of Sep 01 2020 web to define the shape of the yield ellipse you provide the value of k for a valid yield surface the strength ratio must be such that $0 < k < 3$ the particular case of $k = 0$ corresponds to the mises plasticity in general the initial yield strengths in uniaxial compression and in hydrostatic compression σ_c and p_c can be used to calculate the value of k
