International Sourcing Jun 03 2020 Globalization leads to increased fierce competition and companies which do not pursue successful global sourcing within the next five years are probably not able to survive. However, global sourcing projects are highly complex and two-thirds of all sourcing projects in Europe are considered to have failed. A tool of ten steps is elaborated to show how to evaluate the success of sourcing by considering the potentials and risks in an international context. Successful managing of international sourcing, however, does not only imply the primary goal to acquire parts cheaply abroad, but it can be seen as a kind of strategic weapon to create a strong market position and to keep

the company successful on the long term.

Thermodynamic Data, Models, and Phase Diagrams in Multicomponent Oxide Systems

Jun 27 2022 This book involves application of the Calphad method for derivation of a self consistent thermodynamic database for the geologically important system Mg0- Fe0-Fe2O3-Al2O3-SiO2 at pressures and temperatures of Earth's upper mantle and the transition zone of that mantle for Earth. The created thermodynamic database reproduces phase relations at 1 bar and at pressures up to 30 GPa. The minerals are modelled by compound energy formalism, which gives realistic descriptions of their Gibbs energy and takes into account crystal structure data. It incorporates a detailed review of diverse types of experimental data which are used to derive the thermodynamic database: phase equilibria, calorimetric studies, and thermoelastic property measurements. The book also contains tables of thermodynamic properties at 1 bar (enthalpy and Gibbs energy of formation from the elements, entropy, and heat capacity, and equation of state data at pressures from 1 bar to 30 GPa. Mixing parameters of solid solutions are also provided by the book. Table of Contents Introduction to the Series

2022 Since the First International Symposium on Superconductivity (ISS '88) was held in Nagoya, Japan in 1988, significant advances have been achieved in a wide range of high temperature superconductivity research. Although the T_c 's of recently discovered oxide superconductors still do not exceed the record high value of 125K reported before that meeting, the enrichment in the variety of materials should prove useful to the investigation of the fundamental mechanism of superconductivity in these exotic materials. The discovery of the n-type superconducting oxides proved to oppose the previously held empirical fact that the charge carriers in all

oxide superconductors were holes. In addition, optimization of the charge carrier density has been established as a technique to improve the superconducting properties of the previously known oxide materials. Many new experimental and theoretical advances have been made in understanding both the fundamental and the applied aspects of high temperature superconductivity. In this latter area, various new processing techniques have been investigated, and the critical current densities and other significant parameters of both bulk and thin film oxide superconductors are rapidly being improved. At this exciting stage of

research in high temperature superconductivity, it is extremely important to provide an opportunity for researchers from industry, academia, government and other institutions around the world to freely exchange information and thus contribute to the further advancement of research.
